endenic goiter in eastern streria

P. Matsenke Cand Med Sei Irkutsk

Public health workers in the eastern regions of Siberia have been waging a successful fight against endemic goiter which still provails in but a few localities. Recently, personnel of Irkutek Oblast Soiter Station examined imbabitants of 16 rayons and were able to determine the status of this disease. Ordinary iodized table salt was recommended as a prophylactic.

This is one of the few areas where local medical units are receiving satisfactory cooperation from larger institutions. The Irintak area field units have received the full cooperation of the Irintak Medical Institute and the State University. A book seen will be published describing the successful campaign.
